

C++ Basics

① Number ranges

- `int` → around 10^9 (≈ 1 billion)
- `long long` → around 10^{18}

② Input

- `cin >> str` → reads till space (stops at ' ')
- For full line input like "I am Priyansh",
use `getline(cin, str);`
- `getline` reads till '\n' (Enter)

③ Address of a variable

- To get the address of a variable : `&num`

④ Function arguments

- Pass by value : `fun(int x)` → copy is passed
(modifications do not affect original)
- Pass by reference : `fun(int &x)` → original variable
is referenced (changes affect original)

⑤ Arrays

- In functions, array parameters behave like pointers,
so changes inside the function affect the original array.
